

# Content Forge - Project Health Audit

Date: 2026-09-10 | Target: <http://localhost:3100> (production build) + repo state on branch Yash-Gupta.

Method: typecheck, lint, unit tests, production build, live HTTP checks of every page and API route, env/git/config audit, WCAG contrast measurement.

Bottom line: no hard failures. Core app fully works. 2 small defects + 1 missing file + 7 known limitations/observations below.

## Verified working (all PASS)

- [PASS] typecheck (tsc --noEmit), eslint, vitest 4/4, next build (11 routes).
- [PASS] GET / -> 200, GET /privacy -> 200, unknown path -> 404.
- [PASS] GET /api/health -> ok/demoMode, all integrations false (expected locally).
- [PASS] GET /api/state -> browser/null; PUT /api/state -> browser/saved:false (no DATABASE\_URL).
- [PASS] POST /api/assistant valid -> 200 demo plan; short command -> 400.
- [PASS] POST /api/content valid -> 200 demo draft; empty body -> 400.
- [PASS] POST /api/auth/login -> 200 + session cookie; POST /api/auth/logout -> 200.
- [PASS] Text contrast AA: primary 10-17:1, secondary 5.6-7.7:1, badge 10.7:1.
- [PASS] Rename Orbita->Content Forge complete (zero matches outside generated lockfiles).
- [PASS] No secrets committed; no .env files in repo.

## Not working fine / gaps (10 items)

### [MEDIUM] Memory and Settings tabs unreachable on mobile

**Location:** src/components/content-forge-app.tsx:249 (sections.slice(0, 6))

**Evidence:** Mobile header renders only Home..Analytics (6 of 8). No hamburger/menu exposes Memory or Settings on small screens.

**Suggested fix:** Render all 8 sections in the mobile nav (scrollable row) or add a 'More' overflow menu.

### [LOW] .env.example missing but README tells devs to copy it

**Location:** README.md:41 vs repo root (file absent)

**Evidence:** New checkout following the README hits a dead step; devs must guess variable names from README instead.

**Suggested fix:** Add .env.example with empty CONTENT\_FORGE\_ACCESS\_CODE, DATABASE\_URL, AI\_PROVIDER, GEMINI\_/OPENAI\_ keys.

### [LOW] .gitignore covers only node\_modules

**Location:** .gitignore (repo root)

**Evidence:** .next/ and tsconfig.tsbuildinfo show as untracked noise in git status; .env\* files would not be ignored if created.

**Suggested fix:** Extend .gitignore with .next/, \*.tsbuildinfo, .env\*.local and .env\* (keep .env.example tracked).

### [INFO] No persistence without DATABASE\_URL (browser-only mode)

**Location:** GET/PUT /api/state; src/lib/db.ts

**Evidence:** PUT returns {mode:'browser', saved:false}. State lives in localStorage only: single-browser, wiped on cache clear, no multi-device.

**Suggested fix:** Expected locally. For prod: set DATABASE\_URL, run db:migrate, re-test PUT saved:true.

### [INFO] AI providers never execute without keys (demo adapter only)

**Location:** src/lib/ai.ts; /api/health ai:false

**Evidence:** Gemini/OpenAI branches + renamed prompts/schemas (content\_forge\_\*) are live-tested nowhere; only deterministic fallback verified.

**Suggested fix:** After adding keys: smoke-test /api/assistant and /api/content in gemini + openai modes and inspect draft quality.

### [INFO] LinkedIn / X / Reddit are manual placeholders

**Location:** Settings > Platform integrations; /api/health integrations false

**Evidence:** No live connectors; publishing/discovery actions are assistive copy only. Matches README but limits Campaigns/Network value.

**Suggested fix:** Per roadmap: add official OAuth connectors; keep human-approval gate per AGENTS.md.

### [INFO] Auth endpoints functional but unused by the UI

**Location:** src/app/api/auth/\*, src/lib/auth.ts vs no login gate in UI

**Evidence:** Login sets the session cookie correctly, yet the frontend never reads it (gate removed). Dead flow + stale ORBITA references fully renamed but flow untested E2E.

**Suggested fix:** Either re-introduce an optional lock for shared/prod deploys or remove /api/auth/\* + SESSION\_COOKIE to avoid confusion.

### [INFO] Only 4 unit tests; no end-to-end coverage

**Location:** src/lib/content-forge-engine.test.ts; README roadmap item 6

**Evidence:** Onboarding, content approval, campaigns, network, memory, analytics flows have zero automated coverage; regressions surface manually.

**Suggested fix:** Add Playwright smoke tests for login-less home, command plan, draft approve, campaign create (per roadmap).

### [INFO] next-env.d.ts churns between dev and build

**Location:** next-env.d.ts (committed)

**Evidence:** References flip .next/dev vs .next/types on each dev/build run, creating diff noise in commits (seen in 'front end changes\_1').

**Suggested fix:** Leave as-is or regenerate at release time only; do not hand-edit.

### [INFO] Persisted theme values ignored by dark-only UI

**Location:** PersistedState.theme + /api/state schema vs always-dark rendering

**Evidence:** Old saves with theme:'light' load fine but render dark; the field is schema-required yet behaviorally dead.

**Suggested fix:** Harmless. Optional: coerce to 'dark' on load or drop the field in a future schema version.
