

One source. Seven communication formats.

Content Forge converts operator-provided information into structured, reviewable deliverables.

Problem: manual analysis and reformatting repeat effort, introduce inconsistencies and slow communication.

Prepare → configure → generate → review

- Submit text, prompts, PDF/DOCX documents, URLs, images or video.
- Inspect parsed sources, metadata and warnings before generation.
- Control audience, tone, language, detail, objective and style, including individual output overrides.
- Review evidence, refine against the original source and export a ZIP.

Demo templates remain explicit when live services are unavailable.

Shared context, independent outputs

Validated intake → canonical source → shared media analysis and summary
→ parallel schema-validated generators → streamed artefacts
→ transactional Postgres history or browser fallback

- Public URL validation includes DNS, redirect and size checks.
- Source evidence and warnings remain attached to each deliverable.
- Optional ElevenLabs narration and Presenton PPTX preserve text fallbacks.

Incident report → three deliverables

1. Upload the synthetic incident-report PDF; inspect extracted text and page count.
2. Select Advisory, Infographic and Executive Summary.
3. Generate once; inspect three outputs and their source attribution.
4. Download the ZIP, then reopen the job from History. Review Queue records approvals and requested changes.

The paced demo records this sequence. No claims of measured time savings or live-provider validation are implied.

Less repeated work. More operator control.

- Seven format-specific packages from one source and a consistent set of controls.
- Partial failures preserve completed deliverables; missing evidence remains visible.
- Typed schemas, ingestion/API tests and a browser acceptance flow support evaluation.
- Production setup: configure access code, provider keys, database migrations and hosting limits; validate live services.

Source repository + npm setup + architecture + tests + recorded demo. All publication remains operator-approved.
